SUMMARY

I love physics, for its beauty of explaining not only the world, but also our life. I love programming, not only for the convenience coming with it, but also for exploring the otherwise untouchable world without it.

I am interested in looking at local structure (both nucleus and magnetic) of various materials through combined experimental and theoretical approaches. This involves the application of experimental techniques (including neutron/X-ray total scattering, X-ray absorption spectroscopy, etc.) and theoretical simulation (molecular dynamics simulation, density functional theory

calculation, etc.) to understand materials system in a comprehensive way.

Meanwhile, I have been actively contributing to software development for total scattering data reduction and analysis. This involves the development and maintenance of ADDIE and Mantid for reducing neutron total scattering data, ADDIE on cloud for scattering data analysis and RMCProfile for structure modeling based on supercell approach and reverse Monte Carlo algorithm.
