UNIVERSITY OF MICHIGAN

# Overview of GENPMAXS/PARCS Capabilities Utilizing SCALE Cross Sections

Andrew Ward

NERS, University of Michigan

SCALE Users Group Meeting

26-27 September 2017

# Overview

- Introduction
- Two Step Method / Cross Section Generation
- POLARIS/TRITON-GenPMAXS Interface
- TMI Unit 1 POLARIS-PARCS Results
- WB Unit 2 POLARIS-PARCS Results
- UQ for WB Unit 2 (POLARIS/SAMPLE-PARCS)
- Future Plans

# Coupled Neutron / Nuclide Equations

## Neutron Transport Equation (Boltzmann)

$$\frac{1}{v} \frac{\partial \phi}{\partial t} + \Omega \cdot \nabla \phi(r, E, \Omega, t) + \Sigma_t(r, E) \phi(r, E, \Omega, t) = \frac{1}{4\pi} S_f(r, E, t) + \int \int_{\Omega' E'} \Sigma_s(r, E' \rightarrow E, \Omega' \rightarrow \Omega) \phi(r, E', \Omega', t) dE' d\Omega'$$

## Nuclide depletion equation (Bateman)

$$\frac{dN_A(t)}{dt} = -(\sigma_A^a \phi + \lambda_A) N_A(t) + \sigma_C^y \phi N_C(t) + \lambda_B N_B(t)$$

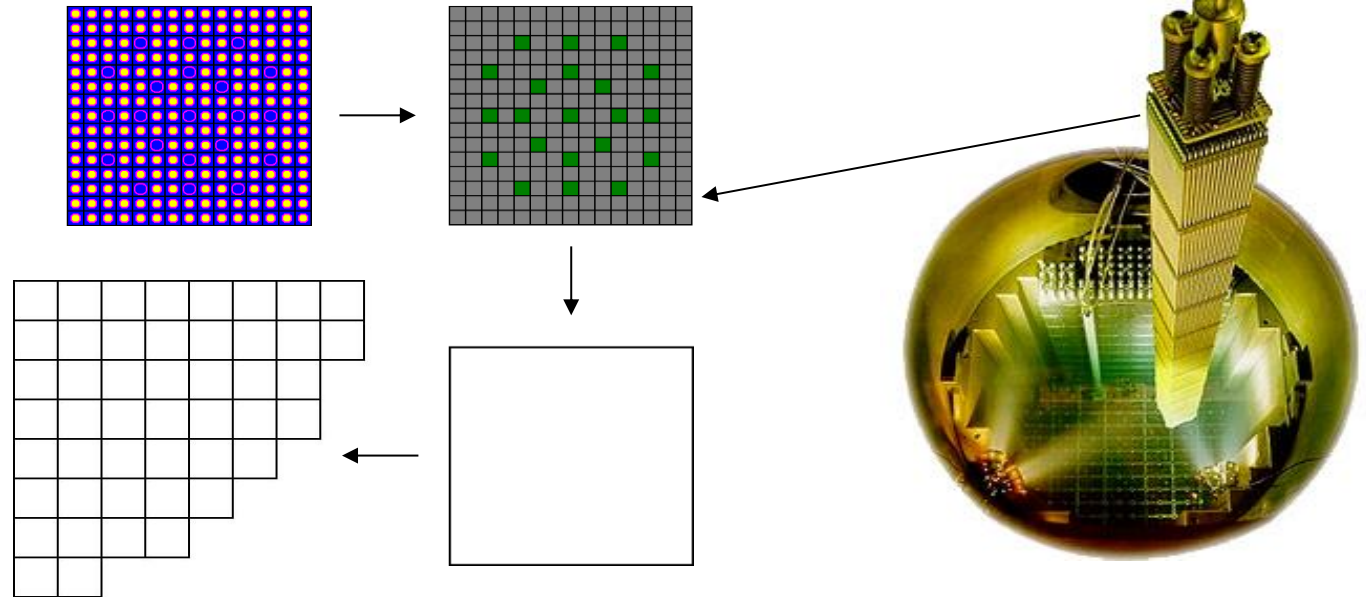

- “2-Step Procedure”

- Pre-generate homogenized coefficients w/  
High Order Solution for fuel  
assembly → POLARIS Calculation
- Diffusion Approximation  
for Core Calculation  
→ PARCS Calculation

- PARCS is the US NRC nodal  
simulator tool, developed  
since 1995

$$\frac{1}{v} \frac{\partial \phi}{\partial t} + \Omega \cdot \nabla \phi(r, E, \Omega, t) + \Sigma_t(r, E) \phi(r, E, \Omega, t) = \frac{1}{4\pi} S_f(r, E, t) + \int \int_{\Omega' E'} \Sigma_s(r, E' \rightarrow E, \Omega' \rightarrow \Omega) \phi(r, E', \Omega', t) dE' d\Omega'$$

“Two-Step”  
 Solution Method

### 1. Lattice calculation

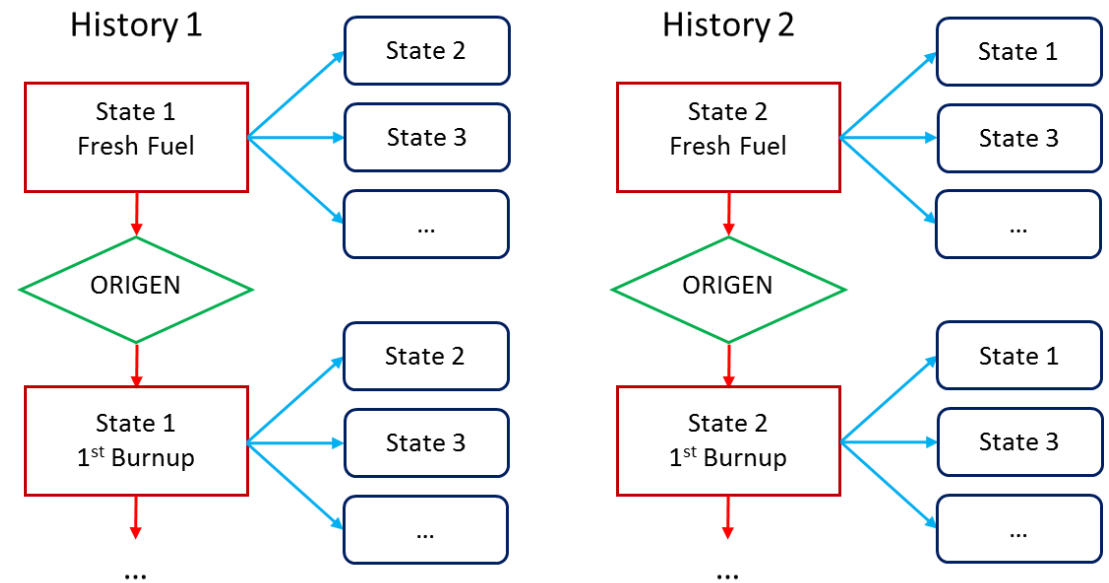

### 2. Core calculation

# POLARIS/TRITON-PARCS XS Generation Method

- Execute  $N_h$  (history) parallel runs with a common set of parameterized state conditions (branches) with burnup
- History cases ( $H_h$ ) and branches depend on reactor type and simulation space (depletion, transient)

## POLARIS/TRITON-GenPMAXS Interface (1/2)

- GenPMAXS: A software tool to read, combine, test, and format raw transport XS data into the PMAXS format
- POLARIS, TRITON, HELIOS, CASMO, SERPENT, and other codes are supported
- Combine histories into single assembly library
- Calculate required library XS derivatives
- Perform 1D flux calculation for discontinuity factors
- Test transport XS for accuracy and convergence

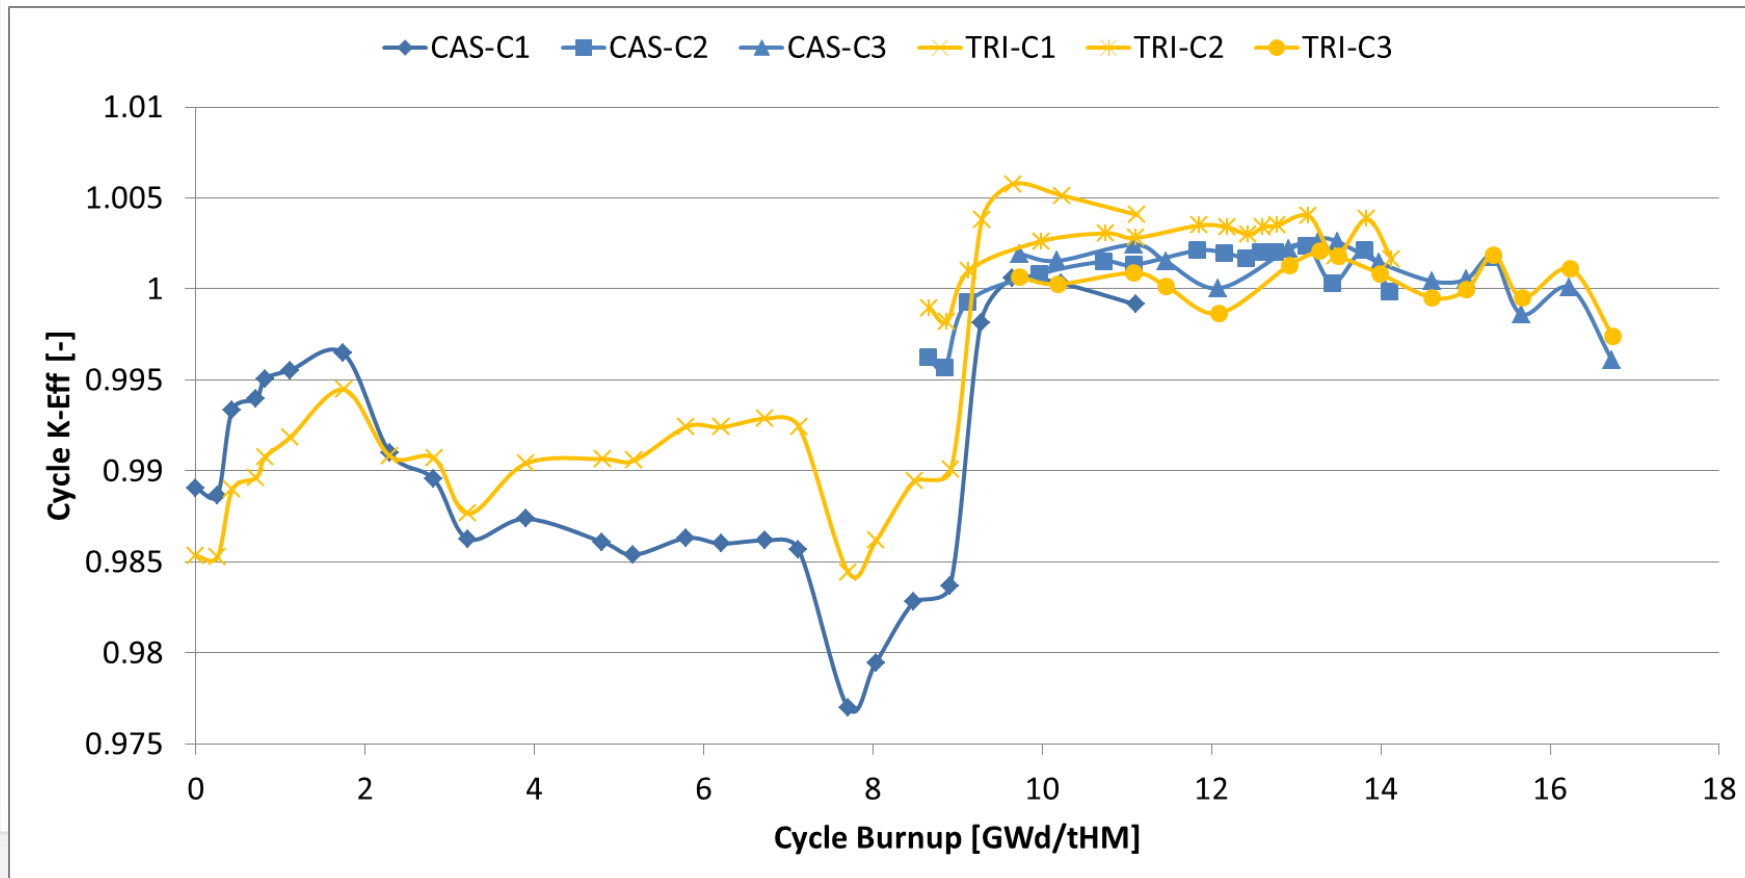

# Experience with TRITON (2005-present)

- Direct experience with LWR depletion
  - BWR: Peach Bottom, Hatch
  - PWR: BEAVRS (Benchmark on physical data)
- Other PARCS users
  - PHWR: CANDU and Atucha (Argentina)
  - Graphite: Prismatic / VHTR
- NRC Staff
  - Some time-dependent accident analyses

# Peach Bottom Depletion (TRITON/PARCS)

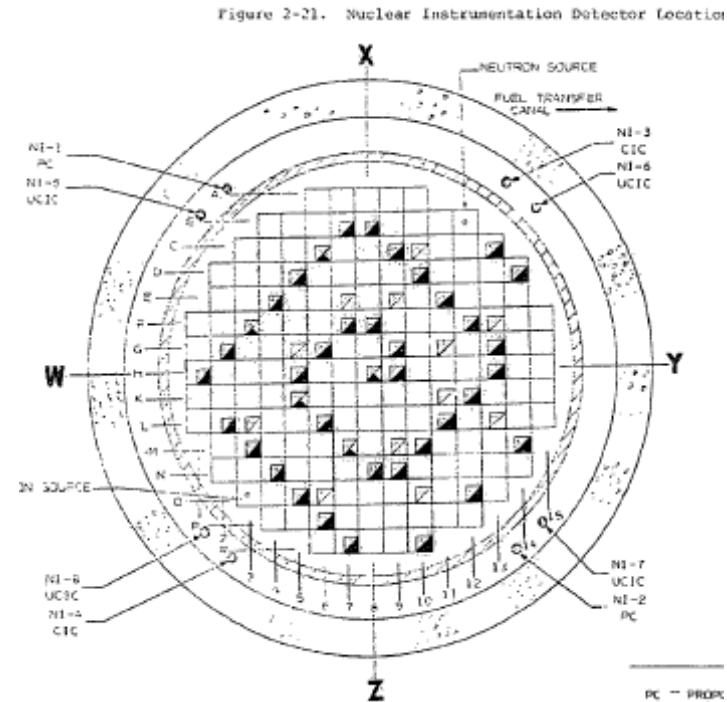

- Cross Sections
  - CASMO-4
  - TRITON
- Good agreement after Cyc 1
- $\pm 500$  pcm desirable

# TMI Unit 1

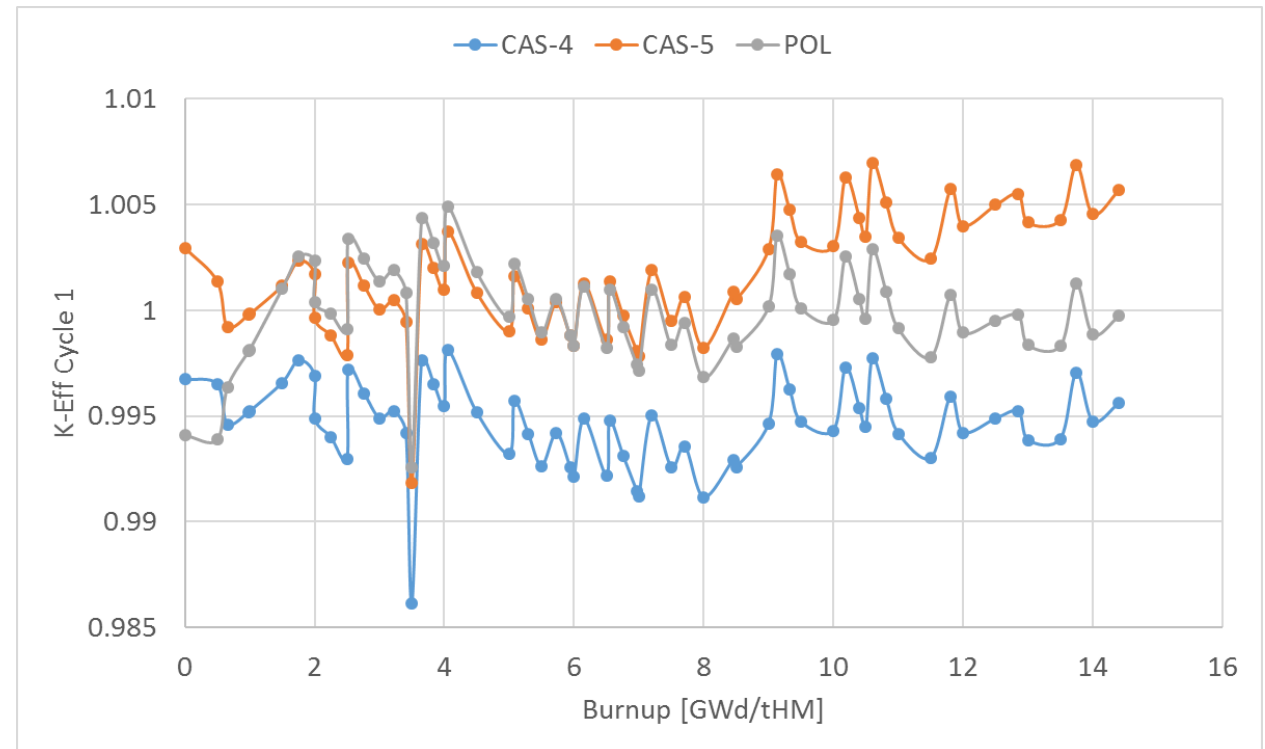

- B&W Plant Design
- 2568 MWt, 560 Assemblies
- Startup April 1974 (FP Sep 74)
- Core follow data for cycles: 1-2

# TMI Unit 1 POLARIS-PARCS

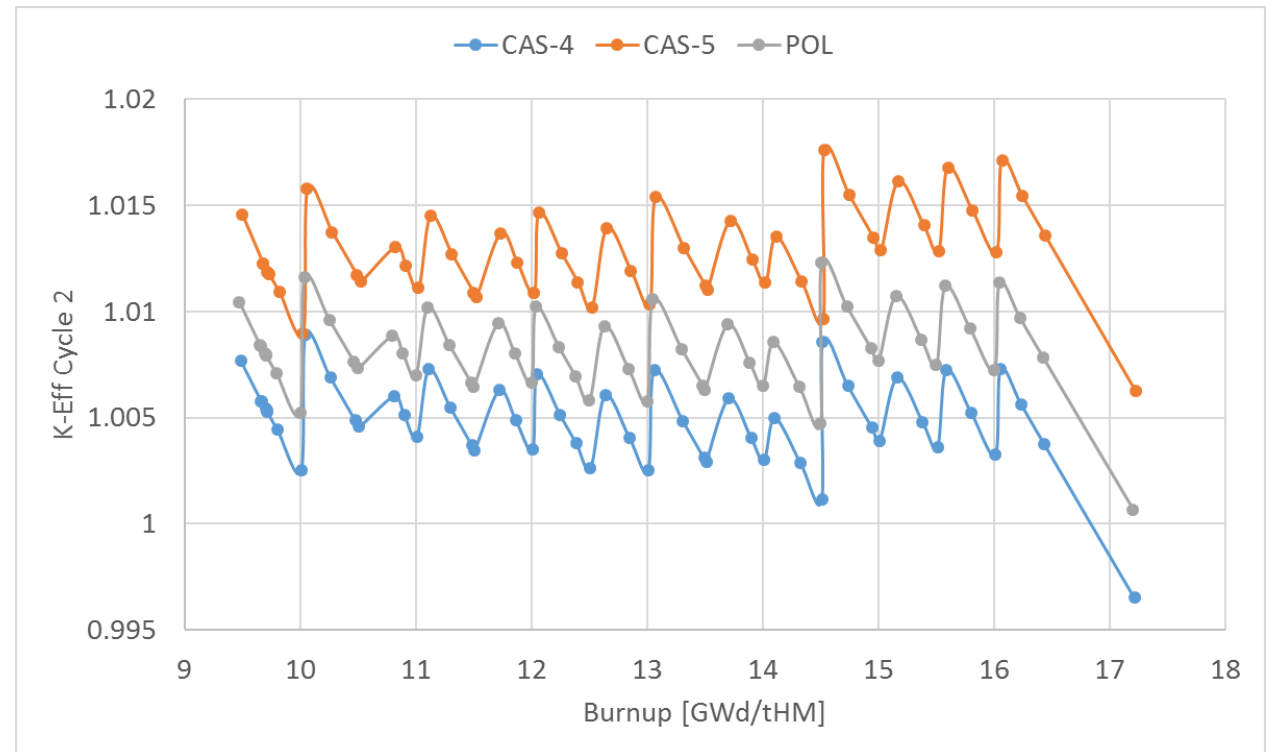

- POLARIS-PARCS calculation
    - Compared to CASMO-4,5
  - Cycle 1 data well verified
  - Generally good agreement with each other
- \*Note: model was under development for this calc

# TMI Unit 1 POLARIS-PARCS

- POLARIS-PARCS calculation
    - Compared to CASMO-4,5
  - Cycle 2 poor quality data
  - Generally good agreement with each other
- \*Note: model was under development for this calc

# Watts Bar Unit 2 POLARIS-PARCS

- Westinghouse PWR
- 193 Fuel Bundles, 3411 MWt
- Full Power, October 2016
- Core follow data for cycles: 1-9

# Watts Bar Cycle 1 Depletion

- Good agreement across the cycle
- No boron measurement at ~10 EFPD

# POLARIS/SAMPLER UQ in PARCS

## Application to POLARIS-PARCS

- Apply the XS uncertainty quantification to WB2 depletion calculation
- Generate ~100 perturbed XS libraries for each fuel material
- ~100 distinct PMAXS libraries per fuel type; each set of PMAXS files have correlated perturbations

## Essence of SAMPLER Sequence

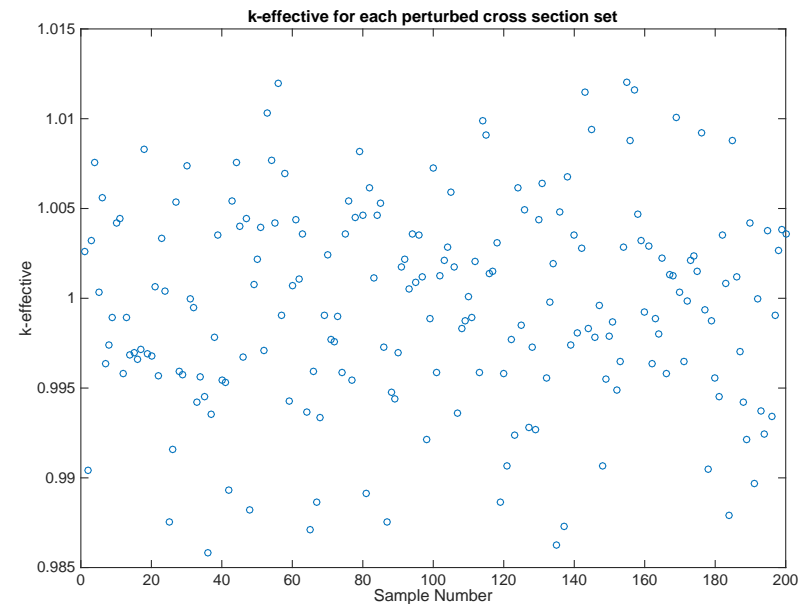

- Random values for the input multigroup cross sections are determined by using the XSUSA program to sample uncertainty data provided in the SCALE covariance library.
- Using these samples, Sampler computes perturbed self-shielded cross sections and propagates the perturbed nuclear data through any specified SCALE analysis sequence including those for criticality safety, lattice physics with depletion, and shielding calculations.

# UQ Results, WB2 HZP Critical Core

- Sampler running mean k-eff for HZP critical core vs. number of samples
- Average k-eff vs. num samples plotted below (red line is KENO k-eff)
- 200 samples generated using Sampler-Polaris module
- Perturbed cross sections used in PARCS nodal calculation

Std. Dev. of k-eff = 565 pcm

Running mean k-eff vs No. Samples

# Sampler/POLARIS/PARCS vs MPACT Cycle 1 Peak Assembly Power

- Measurement not available; comparison to MPACT (transport)
- Axially integrated radial power. MPACT data lies within error margins of PARCS/Sampler/Polaris results.
- Partial shutdown around 375 EFPD modelled slightly differently in PARCS.

## Conclusions & Discussion

- Confidence in POLARIS/TRITON-GenPMAXS-PARCS Sequence
- Work has begun to develop POLARIS XS for Hatch (BWR)
  - Well-validated PARCS-PATHS simulation using other XS sources
- Sampler Based UQ sequence well tested
- Plan to expand detector and pin power calculation support soon
- Confidence in overall approach and results

# Acknowledgements

- Matt Jessee (ORNL)
  - Setup and executed the UQ sequences in SCALE
- Kevin Xu (UM)
  - Evaluated the UQ XS with PARCS
  - Developed presentation material
